

# Family History as a Risk Factor

Family History	Risk for CRC by age 79*
No family history	4%
One FDR with colorectal adenomas	8%
One FDR with colorectal cancer	9%
One FDR diagnosed with colorectal cancer before age 45	15%
More than one FDR with colorectal cancer	16%

\* Data from SEER database

\*\*The absolute risks of CRC for individuals with affected relatives was calculated using the relative risks for CRC (37 NCI ref# 37) and the absolute risk of CRC by age 79\*

CI = Confidence interval

FDR = First-degree relative
